## Supplementary information for:

# Macromolecular modeling and design in Rosetta: new methods and frameworks

Rosetta is licensed and distributed through [www.rosettacommons.org](http://www.rosettacommons.org). Licenses for academic, non-profit and government laboratories are free of charge, there is a license fee for industry users.

The main documentation page can be found at <https://www.rosettacommons.org/docs/latest/Home>.

Tutorials, demos and protocol captures are documented at <https://www.rosettacommons.org/demos/latest/Home>.

RosettaScripts documentation is available at [https://www.rosettacommons.org/docs/latest/scripting\\_documentation/RosettaScripts/RosettaScripts](https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/RosettaScripts).

PyRosetta tutorials are available at <http://www.pyrosetta.org/tutorials>.

Method	Use	Developer(s)	Lab developed	Documentation	Protocol capture / demo	Limitations	Competing methods
<b>Protein structure prediction</b>							
fragment picker <sup>1</sup>	picks protein fragments for various modeling tasks	Dominik Gront	Dominik Gront**	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/utilities/app-fragment-picker">https://www.rosettacommons.org/docs/latest/application_documentation/utilities/app-fragment-picker</a>	Rosetta/demos/public/fragment_picking		
RosettaCM <sup>2</sup>	comparative modeling from multiple templates	Yifan Song	formerly David Baker	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/structure_prediction/RosettaCM">https://www.rosettacommons.org/docs/latest/application_documentation/structure_prediction/RosettaCM</a>	Rosetta/demos/public/homology_modeling_threading_basic Supp to <sup>2</sup>	model quality depends on manual adjustment of sequence alignment, which can take time to do well	MODELLER <sup>3</sup> , iTasser <sup>4</sup> , HHpred <sup>5</sup>
iterative hybridize <sup>6,7</sup>	recombination of model substructures for <i>de novo</i> modeling	Sergey Ovchinnikov, Hahnbeom Park	David Baker, Sergey Ovchinnikov	<a href="https://www.rosettacommons.org/docs/latest/IterativeHybridize">https://www.rosettacommons.org/docs/latest/IterativeHybridize</a>			
<b>Loop modeling</b>							MODELLER <sup>8</sup>
NGK (next-generation KIC) <sup>9</sup>	<i>Next Generation Kinematic loop closure</i>	Amelie Stein	Tanja Kortemme	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/structure_prediction/loop_modeling/next-generation-KIC">https://www.rosettacommons.org/docs/latest/application_documentation/structure_prediction/loop_modeling/next-generation-KIC</a> <a href="https://www.rosettacommons.org/docs/latest/application_documentation/structure_prediction/loop_modeling/loopmodel-kinematic">https://www.rosettacommons.org/docs/latest/application_documentation/structure_prediction/loop_modeling/loopmodel-kinematic</a> (for -vicinity_sampling)	Rosetta/demos/tutorials/loop_modeling	performance deteriorates for loops longer than 12 residues, as all loop modeling methods do	Sphinx <sup>10</sup> , DiSGro <sup>11</sup>
LoopHashKIC	uses a loop database and KIC for loop design	Xingjie Pan	Tanja Kortemme	<a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_pages/LoopModelerMover">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_pages/LoopModelerMover</a>			
Consensus_Loop_Design <sup>12,13</sup>	uses sequence profiles of known loops to design new ones	Enrique Marcos, Tom Linsky	David Baker	<a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/TaskOperations/task_operations_pages/ConsensusLoopDesignOperation">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/TaskOperations/task_operations_pages/ConsensusLoopDesignOperation</a>	Rosetta/main/tests/integration/tests/ConsensusLoopDesign		LOOPY <sup>14</sup> , PLOP <sup>15</sup> , PS1 <sup>16</sup> , PS2 <sup>17</sup>
GenKIC (generalized KIC) <sup>18</sup>	<i>Generalized Kinematic loop Closure</i> : robotics based approach to sample non-canonical loop conformations	Vikram Mulligan	Richard Bonneau*	<a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/composite_protocols/generalized_kic/GeneralizedKIC">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/composite_protocols/generalized_kic/GeneralizedKIC</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_pages/GeneralizedKICMover">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_pages/GeneralizedKICMover</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/composite_protocols/generalized_kic/GeneralizedKICperturber">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/composite_protocols/generalized_kic/GeneralizedKICperturber</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/composite_protocols/generalized_kic/GeneralizedKICfilter">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/composite_protocols/generalized_kic/GeneralizedKICfilter</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/composite_protocols/generalized_kic/GeneralizedKICselector">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/composite_protocols/generalized_kic/GeneralizedKICselector</a>	<a href="https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_1">https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_1</a> , <a href="https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_2">https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_2</a> , <a href="https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_3">https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_3</a> , <a href="https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_4">https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_4</a> Supp to <sup>18,19</sup>	generality requires more setup and can be less efficient than more biased methods; parameter tuning can require some experience	molecular dynamics simulation packages

Method	Use	Developer(s)	Lab developed	Documentation	Protocol capture / demo	Limitations	Competing methods
				<a href="https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_1">https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_1</a> <a href="https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_2">https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_2</a> <a href="https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_3">https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_3</a> <a href="https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_4">https://www.rosettacommons.org/demos/latest/tutorials/GeneralizedKIC/generalized_kinematic_closure_4</a>			
<b>Protein-protein docking</b>							
RosettaDock4.0 <sup>20</sup>	protein-protein docking	Nick Marze, Shourya Roy Burman	Jeffrey Gray	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/docking/docking-protocol">https://www.rosettacommons.org/docs/latest/application_documentation/docking/docking-protocol</a>	Rosetta/demos/tutorials/Protein-Protein-Docking <a href="https://www.rosettacommons.org/demos/latest/tutorials/Protein-Protein-Docking/Protein-Protein-Docking">https://www.rosettacommons.org/demos/latest/tutorials/Protein-Protein-Docking/Protein-Protein-Docking</a>	global docking requires two orders or magnitude more sampling than local docking – in these cases RosettaDock is slower than FFT-based methods; like for other tools, large conformational changes make docking difficult	InterEVDock <sup>21</sup> , ClusPro <sup>22</sup> , GalaxyTongDock <sup>23</sup> , HADDOCK <sup>24</sup> , PPI3D <sup>25</sup>
Rosetta SymDock2 <sup>26</sup>	docking of symmetric proteins	Shourya Roy Burman	(formerly Ingemar André), Jeffrey Gray	<a href="https://www.rosettacommons.org/docs/latest/SymDockProtocol">https://www.rosettacommons.org/docs/latest/SymDockProtocol</a>		SymDock is sensitive to quality of input monomer; as with other algorithms, performance deteriorates for higher-order symmetries	GalaxyTongDock <sup>23</sup> , SAM <sup>27</sup> , HSYMDOCK <sup>28</sup>
<b>Small molecule ligand docking</b>							
RosettaLigand <sup>29-31</sup>	small molecule docking to proteins	Sam DeLuca, Darwin Fu, Shannon Smith, Rocco Moretti	Jens Meiler	<a href="https://www.rosettacommons.org/demos/latest/tutorials/ligand_docking/ligand_docking_tutorial">https://www.rosettacommons.org/demos/latest/tutorials/ligand_docking/ligand_docking_tutorial</a>	Rosetta/demos/tutorials/ligand_docking	not as fully a dynamic approach as MD simulations; performs worse in more solvent-exposed pockets or small pockets; requires ligand conformers to be pre-generated; assumes ligand binding site is known	AutoDock Vina <sup>32</sup> , GlideScore <sup>33</sup> (Schrodinger), DrugScore <sup>34</sup> , Molecular Operating Environment (MOE) <sup>35</sup> from Chemical Computing Group, GOLD <sup>36</sup>
RosettaLigandEnsemble <sup>37</sup>	docks ligand ensembles into proteins	Darwin Fu, Rocco Moretti	Jens Meiler	<a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_pages/HighResEnsembleMover">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_pages/HighResEnsembleMover</a>	Rosetta/demos/protocol_capture/rosettaligand_ensemble	same limitations as RosettaLigand; assumes ligands in ensemble follow similar binding modes	HybridDock <sup>38</sup>
pocket optimization <sup>39,40</sup>	samples binding pocket conformations during docking	David Johnson	John Karanicolas	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/utilities/pocket-relax">https://www.rosettacommons.org/docs/latest/application_documentation/utilities/pocket-relax</a> <a href="https://www.rosettacommons.org/docs/latest/application_documentation/analysis/pocket-measure">https://www.rosettacommons.org/docs/latest/application_documentation/analysis/pocket-measure</a>	Supp to <sup>39,40</sup>		competitors use small probe molecules (FTMap <sup>41</sup> ) or molecular dynamics <sup>42</sup>
DARC <sup>43-45</sup>	<i>Docking Approach using Ray Casting</i> : identifies binding pockets	Ragul Gowthaman, Karen Khar	John Karanicolas	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/docking/DARC">https://www.rosettacommons.org/docs/latest/application_documentation/docking/DARC</a>	Rosetta/demos/public/darc Supp to <sup>43-45</sup>		there are numerous approaches (f.ex. DOCKTITE <sup>46</sup> in MOE) for small-molecule docking / virtual screening, but none really comparable to how DARC works
<b>Modeling of antibodies and immune system proteins</b>							
RosettaAntibody <sup>47-50</sup>	antibody homology modeling and docking	Jeliazko Jeliazkov, Nick Marze, Brian Weitzner, Jared Adolf-Bryfogle, Sergey Lyskov, Daisuke Kuroda	Jeffrey Gray	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/antibody/antibody-protocol">https://www.rosettacommons.org/docs/latest/application_documentation/antibody/antibody-protocol</a>	Rosetta/main/tests/integration/tests/antibody_cc	performance deteriorates for loops longer than 12 residues; unusual CDR loops are hard to model because they are likely not represented in the database	SAbPred <sup>51</sup> , PIGS <sup>52</sup> , BIOVIA Discovery Studio <sup>53</sup> , MOE <sup>54</sup> , Schrodinger <sup>55</sup>
AbPredict <sup>56,57</sup>	antibody structure prediction	Christoffer Norn, Gideon Lapidoth	Sarel Fleishman	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/structure_prediction/AbPredict2">https://www.rosettacommons.org/docs/latest/application_documentation/structure_prediction/AbPredict2</a>	<a href="https://www.rosettacommons.org/demos/latest/tutorials/AbPredict/AbPredict">https://www.rosettacommons.org/demos/latest/tutorials/AbPredict/AbPredict</a>	performance deteriorates for loops longer than 12 residues; unusual CDR loops are hard to model because they are likely not represented in the database	SAbPred <sup>51</sup> , PIGS <sup>52</sup> , BIOVIA Discovery Studio <sup>53</sup> , MOE <sup>54</sup> , Schrodinger <sup>55</sup>

Method	Use	Developer(s)	Lab developed	Documentation	Protocol capture / demo	Limitations	Competing methods
RosettaMHC <sup>58</sup>	modeling and docking of antigen / MHC-I / (chaperone or T-cell receptor)	Santrupti Nerli	Nik Sgourakis	<a href="https://github.com/snerligit/mhc-pep-threader">https://github.com/snerligit/mhc-pep-threader</a>	<a href="https://github.com/snerligit/mhc-pep-threader/tree/master/examples">https://github.com/snerligit/mhc-pep-threader/tree/master/examples</a>	the binding energies cannot fully discriminate best binders from average binders	bioinformatics-based methods <sup>59</sup> : NetMHCpan <sup>60</sup> , MHCFlurry <sup>61</sup> structure-based methods <sup>62</sup> : AutoDock <sup>63</sup> , DINC <sup>64</sup>
TCRModel <sup>65</sup>	structure prediction of T-cell receptors	Ragul Gowthaman	Brian Pierce	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/structure_prediction/TCRmodel">https://www.rosettacommons.org/docs/latest/application_documentation/structure_prediction/TCRmodel</a>	Rosetta/main/tests/integration/tests/tcrmodel	challenging to model long CDR loops	LYRA <sup>66</sup> , ImmuneScape <sup>67</sup>
SnugDock <sup>68</sup>	docking of antibody-antigen complexes	Jeliazko Jeliazkov, Nick Marze, Brian Weitzner	Jeffrey Gray	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/antibody/snugdock">https://www.rosettacommons.org/docs/latest/application_documentation/antibody/snugdock</a>	Rosetta/main/tests/integration/tests/SnugDock	performance deteriorates for loops longer than 12 residues; cannot predict large backbone motions from unbound to bound state in antigen	usually for FFT methods developers design Ab/Ag specific potentials or paratope/epitope predictions and then combine this with docking methods: ClusPro <sup>69</sup> , PatchDock <sup>70</sup> , Antibody I-patch <sup>71</sup>
<b>Design of antibodies and immune system proteins</b>							
RABD <sup>72</sup> (Rosetta AntibodyDesign)	design of antibody-antigen interfaces	Jared Adolf-Bryfogle, Brian Weitzner	Bill Schief, Roland Dunbrack	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/antibody/RosettaAntibodyDesign">https://www.rosettacommons.org/docs/latest/application_documentation/antibody/RosettaAntibodyDesign</a>	Rosetta/main/tests/integration/tests/antibody_designer	antigen structure must be known or predicted; well-behaved starting antibody must be given for <i>de novo</i> design	OptCDR <sup>73</sup> , OptMaven <sup>74</sup>
Epitope removal <sup>75,76</sup>	identifies and removes immunogenic epitopes	Indigo King	David Baker, Cyrus Biotechnology	<a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_pages/GreedyOptMutationMover">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_pages/GreedyOptMutationMover</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/xsd/filter_NMerSVMEnergyType">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/xsd/filter_NMerSVMEnergyType</a>			EpiSweep <sup>77</sup> as part of DisrupPI <sup>78</sup>
AbDesign <sup>79,80</sup>	antibody design	Gideon Lapidot	Sarel Fleishman	<a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/SpliceOut">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/SpliceOut</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/SpliceOutAntibody">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/SpliceOutAntibody</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/SpliceInAntibody">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/SpliceInAntibody</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/SpliceIn">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/SpliceIn</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/SpliceOutTail">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/SpliceOutTail</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/SpliceInTail">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/SpliceInTail</a>	Rosetta/main/tests/integration/tests/splice_out_H1_H2_longer Rosetta/main/tests/integration/tests/splice_out_H1_H2_same Rosetta/main/tests/integration/tests/splice_out_H1_H2_shorter Rosetta/main/tests/integration/tests/splice_out_H3_longer Rosetta/main/tests/integration/tests/splice_out_H3_same Rosetta/main/tests/integration/tests/splice_out_H3_shorter Rosetta/main/tests/integration/tests/splice_out_L1_L2_longer Rosetta/main/tests/integration/tests/splice_out_L1_L2_same Rosetta/main/tests/integration/tests/splice_out_L1_L2_shorter Rosetta/main/tests/integration/tests/splice_out_L3_longer Rosetta/main/tests/integration/tests/splice_out_L3_same Rosetta/main/tests/integration/tests/splice_out_L3_shorter	deep-learning based methods <sup>81-83</sup>	
<b>Protein design</b>							
competitors: review <sup>84</sup> , MOE (CCG, Montreal) can be used for manual, not automated, protein design. Supports live energy minimization during design. No appropriate publications							
SEWING <sup>85,86</sup>	Structure Extension With Native-	Tim Jacobs, Sharon Guffy, Frank Teets	Brian Kuhlmann	<a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/composite_protocols/ewing/SEWING">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/composite_protocols/ewing/SEWING</a>		different scores scale differently with size, so top-scoring outputs of a particular run show limited size diversity; restricted to $\alpha$ -	Sibe <sup>87</sup> , CCBUILDER <sup>88</sup>

Method	Use	Developer(s)	Lab developed	Documentation	Protocol capture / demo	Limitations	Competing methods
	<i>substructure Graphs</i> : recombination of protein substructures to create new designs					helical chimerizable regions; starting point must be single chain; to build from point to point requires additional loop closure step; precludes sampling of backbone motion resulting in high false negative rate	
RosettaRemodel <sup>89</sup>	framework for custom protein remodeling	Possu Huang	Possu Huang* <sup>**</sup>	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/design/rosettaremodel">https://www.rosettacommons.org/docs/latest/application_documentation/design/rosettaremodel</a>			
LooDo <sup>90</sup>	LOOp-directed DOrmain insertion	Kristin Blacklock	Sagar Khare	<a href="https://www.rosettacommons.org/demos/latest/protocol_capture/loodo/README">https://www.rosettacommons.org/demos/latest/protocol_capture/loodo/README</a>	Rosetta/demos/protocol_capture/loodo		competitors are Remodel, any homology modeling or <i>de novo</i> design package; few are specialized for domain insertion in loops
RECON <sup>91</sup>	REstrained CONvergence for multi-state design	Alex Sevy, Marion Sauer	Jens Meiler	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/RECON-multistate-design">https://www.rosettacommons.org/docs/latest/application_documentation/RECON-multistate-design</a>	<a href="https://github.com/sevya/msd_analysis_scripts">https://github.com/sevya/msd_analysis_scripts</a> <a href="https://github.com/sevya/parallelized_RECON_protocol_capture">https://github.com/sevya/parallelized_RECON_protocol_capture</a> Supp to <sup>91</sup>	computational requirements; overestimates sequence conservation of the native sequence; under-samples mutations tolerated in related PSI-BLAST profiles during design	no direct competitor; RosettaBackrub <sup>92</sup> ; MSD-FASTER <sup>93</sup> , dead-end elimination <sup>94</sup> , CLASSY <sup>95</sup>
curved $\beta$ -sheet design <sup>12</sup>	design of curved $\beta$ -sheets	Enrique Marcos, Benjamin Basanta	David Baker	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/design/curvedsheetdesign">https://www.rosettacommons.org/docs/latest/application_documentation/design/curvedsheetdesign</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/xsd/filter_StrandCurvatureByLevels_type">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/xsd/filter_StrandCurvatureByLevels_type</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/xsd/filter_HelixBendFilter_type">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/xsd/filter_HelixBendFilter_type</a>	<a href="https://github.com/basantab/DeNovoCurvedSheetDesign">https://github.com/basantab/DeNovoCurvedSheetDesign</a>	although the fragment assembly should allow construction of arbitrary protein folds, the scripts referenced are limited to NTF2-like proteins; similar setups have been used for generation of <i>de novo</i> $\beta$ -barrel proteins	no known competitors outside of Rosetta
biased forward folding <sup>12</sup>	consistency check for designs	Daniel Silva, Enrique Marcos	David Baker	<a href="https://www.rosettacommons.org/docs/latest/Biased-forward-folding">https://www.rosettacommons.org/docs/latest/Biased-forward-folding</a> <a href="https://github.com/emarcos/biased_forward_folding/">https://github.com/emarcos/biased_forward_folding/</a>		not suitable for <i>ab initio</i> structure prediction or exhaustive conformational sampling	no known competitors outside of Rosetta
fold_from_loops <sup>96</sup>	designs topology around starting loops	Bruno Correia	Bruno Correia* <sup>**</sup>	<a href="#">replaced by FunFolDes below</a>		FunFolDes supersedes fold_from_loops	
FunFolDes <sup>97</sup>	<i>FUN</i> ctional <i>FOL</i> ding and <i>DES</i> ign: design topology around a functional motif	Jaume Bonet, Andreas Scheck	Bruno Correia	<a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/composite_protocols/fold_from_loops/FunFolDes">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/composite_protocols/fold_from_loops/FunFolDes</a>	<a href="https://github.com/lpdi-epfl/FunFolDesData">https://github.com/lpdi-epfl/FunFolDesData</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/composite_protocols/fold_from_loops/RunningFunFolDes">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/composite_protocols/fold_from_loops/RunningFunFolDes</a>	FunFolDes aims to be of use when transferring highly divergent structural motifs, but when the motif and the target region are structurally similar, one would recommend MotifGraft. FunFolDes makes sense to use when the structural divergence is such that it is unavoidable for chain breaks to appear in the final designs.	no known competitors outside of Rosetta; main competitor is MotifGraft <sup>98</sup> in terms of incorporating structural motifs into a topology, even though their goals are different
<b>Protein interface design</b>							
FlexDDG <sup>99</sup>	flexible backbone $\Delta\Delta G$ prediction for interfaces	Kyle Barlow, Shane O'Connor	Tanja Kortemme	<a href="https://github.com/Kortemme-Lab/flex_ddg_tutorial">https://github.com/Kortemme-Lab/flex_ddg_tutorial</a>	<a href="https://github.com/Kortemme-Lab/flex_ddg_tutorial">https://github.com/Kortemme-Lab/flex_ddg_tutorial</a>	not designed for $\Delta\Delta G$ prediction for protein stability even though it outperforms <i>ddg_monomer</i> which was created for stability prediction	
Coupled Moves <sup>100</sup>	couples flexibility in backbone, sidechains, and ligand for interface design	Noah Ollikainen, Rene M. de Jong	Tanja Kortemme & DSM Biotechnology Center	<a href="https://www.rosettacommons.org/docs/latest/coupled-moves">https://www.rosettacommons.org/docs/latest/coupled-moves</a>	Rosetta/main/tests/integration/tests/coupled_moves		

Method	Use	Developer(s)	Lab developed	Documentation	Protocol capture / demo	Limitations	Competing methods
Parametric design <sup>19,101</sup>	bundle and supercoil design from custom parameters	Vikram Mulligan	Richard Bonneau*	<a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_page_s/MakeBundleMover">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_page_s/MakeBundleMover</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_page_s/BundleGridSamplerMover">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_page_s/BundleGridSamplerMover</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_page_s/PerturbBundleMover">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_page_s/PerturbBundleMover</a> <a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Filters/filter_pages/BundleReporterFilter">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Filters/filter_pages/BundleReporterFilter</a>	Supp to <sup>19</sup>	huge parameter space to sample: $D^N$ with $D$ being number of discrete steps and $N$ being number of parameters. For 5 parameters per helix, 10 steps for each parameter and 3 helices, this would be $10^{15}$ combinations; parameter sampling is only good for topologies that fall within the parameter space	CCBuilder <sup>88</sup>
<b>Peptides and peptidomimetics</b>							
FlexPepDock <sup>102,103</sup>	docking of a flexible peptide into a target protein	Barak Raveh, Nir London, Lior Zimmerman	Ora Schueler-Furman	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/docking/flex-pep-dock">https://www.rosettacommons.org/docs/latest/application_documentation/docking/flex-pep-dock</a>	Rosetta/demos/public/flex_pep_dock_abinitio Rosetta/demos/public/abinitio_fold_and_dock_of_peptides_using_flexpepdock Rosetta/demos/public/global_dock_ssrA_peptide_against_sspB Rosetta/demos/public/peptide_specificity_using_FlexPepBind Rosetta/demos/public/refinement_of_protein_peptide_complex_using_FlexPepDock Supp to <sup>103</sup>	Both for local refinements, and in particular for <i>ab initio</i> docking into a binding site, FlexPepDock is much more CPU expensive than comparable methods. Receptor backbone flexibility has been calibrated for minimization only and therefore conformational changes are of limited extent.	
PIPER-FlexPepDock <sup>104</sup>	flexible peptide docking using FFT-based approach	Nawsad Alam, Alisa Khramushin	Ora Schueler-Furman	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/docking/flex-pep-dock">https://www.rosettacommons.org/docs/latest/application_documentation/docking/flex-pep-dock</a>		Successful global docking of peptides (starting from peptide sequence and given receptor structure, without any information about the peptide conformation or the peptide binding site on the receptor) is limited to instances where an approximate bound peptide conformation is represented in the fragment set that is rigid body docked in the first step of the docking protocol.	pepATTRACT <sup>105</sup> , GalaxyPepDock <sup>106</sup> , HADDOCK <sup>107</sup> , CABSDock <sup>108</sup> , PeptiDock <sup>109</sup> , more methods are summarized in this book <sup>110</sup>
PeptiDerive <sup>111</sup>	identifies peptide segment that mediate PPIs	Yuval Sedan, Orly Marcu	Ora Schueler-Furman	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/analysis/PeptiDerive">https://www.rosettacommons.org/docs/latest/application_documentation/analysis/PeptiDerive</a>	Rosetta/main/tests/integration/tests/peptiderive		LoopFinder <sup>112</sup>
simple_cycpep_predict <sup>18,19,113</sup>	sample peptide conformations through cyclization	Vikram Mulligan	Richard Bonneau*	<a href="https://www.rosettacommons.org/docs/latest/structure_prediction/simple_cycpep_predict">https://www.rosettacommons.org/docs/latest/structure_prediction/simple_cycpep_predict</a>	Rosetta/main/tests/integration/tests/simple_cycpep_predict and many related demos adjacent, Supp to <sup>18,113</sup>	generality requires more unbiased sampling, therefore slower; limited to 10-12 residue macrocycles, larger only reasonable with additional constraints	molecular dynamics simulation packages
MFPred <sup>114</sup>	mean field approach to predict peptide binding sites for multi-specificity	Aliza Rubenstein	Sagar Khare	<a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_page_s/analysis/GenMeanFieldMover">https://www.rosettacommons.org/docs/latest/scripting_documentation/RosettaScripts/Movers/movers_page_s/analysis/GenMeanFieldMover</a>	Rosetta/main/tests/integration/tests/mf_fixbb_sc Rosetta/main/tests/integration/tests/mf_fixbb_sc	dependent on free parameters and optimal parameters depend on the system; no sampling of receptor backbone flexibility	sequence_tolerance <sup>115</sup> , PepSpec <sup>116</sup>
RosettaSurface <sup>117-119</sup>	peptide modeling on biomolecular surfaces	Michael Pacella	Jeffrey Gray	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/docking/surface-docking">https://www.rosettacommons.org/docs/latest/application_documentation/docking/surface-docking</a>	Rosetta/demos/public/surface_docking_cpp Supp to <sup>117</sup>	does not allow 3-body docking	methods reviewed in <sup>120</sup> , CHARMM <sup>121</sup> , AMBER <sup>122</sup> , GRAPPA <sup>123</sup> , Interfacial Force Field <sup>124</sup>
<b>Modeling with experimental data</b>							
cryoEM <i>de novo</i> <sup>125</sup>	assigns sequence to density <i>de novo</i>	Ray Wang	Frank DiMaio, David Baker	<a href="https://dimaiolab.ipd.uw.edu/software/">https://dimaiolab.ipd.uw.edu/software/</a>	<a href="https://dimaiolab.ipd.uw.edu/software/">https://dimaiolab.ipd.uw.edu/software/</a>	performance gets a lot worse >600 residues; resolution limit around 4.5Å	Phenix <sup>126</sup> , Buccaneer <sup>127</sup>
cryoEM: RosettaES <sup>128</sup>	assigns sequence to density <i>de novo</i> , but via enumerative sampling	Brandon Frenz	Frank DiMaio	<a href="https://dimaiolab.ipd.uw.edu/software/">https://dimaiolab.ipd.uw.edu/software/</a>	<a href="https://dimaiolab.ipd.uw.edu/software/">https://dimaiolab.ipd.uw.edu/software/</a>		no real competitors (maybe <i>de novo</i> tools)

Method	Use	Developer(s)	Lab developed	Documentation	Protocol capture / demo	Limitations	Competing methods
cryoEM: iterative refinement <sup>129</sup>	model refinement into density map	Frank DiMaio, Yifan Song	(formerly David Baker), Frank DiMaio	<a href="https://dimaiolab.ipd.uw.edu/software/">https://dimaiolab.ipd.uw.edu/software/</a>	<a href="https://dimaiolab.ipd.uw.edu/software/">https://dimaiolab.ipd.uw.edu/software/</a>	reasonable-quality starting model needs to be available	no real competitors (maybe <i>de novo</i> tools)
cryoEM: automated refinement <sup>130</sup>	automated pipeline for refinement into density maps	Ray Wang	Frank DiMaio	<a href="https://dimaiolab.ipd.uw.edu/software/">https://dimaiolab.ipd.uw.edu/software/</a>	<a href="https://dimaiolab.ipd.uw.edu/software/">https://dimaiolab.ipd.uw.edu/software/</a>	reasonable-quality starting model needs to be available for all methods (also competing methods) but performance of Rosetta is better than competing methods <sup>130</sup>	Phenix Refine <sup>131</sup> , CCP-EM REFMAC <sup>132</sup>
NMR: CS-Rosetta <sup>133</sup>	structure prediction using chemical shifts and RDC/NOE	(formerly Oliver Lange) Santrupti Nerli	Nik Sgourakis	<a href="https://csrosetta.chemistry.ucsc.edu/">https://csrosetta.chemistry.ucsc.edu/</a> <a href="https://github.com/RosettaCommons/csrosetta3">https://github.com/RosettaCommons/csrosetta3</a>	<a href="https://csrosetta.chemistry.ucsc.edu/">https://csrosetta.chemistry.ucsc.edu/</a> <a href="https://github.com/RosettaCommons/csrosetta3">https://github.com/RosettaCommons/csrosetta3</a>	depending on the specific needs, setup can be a bit challenging due to lack of good tutorials or protocol captures	competitive methods review: <sup>134</sup> ; Xplor-NIH <sup>135</sup> , CYANA <sup>136</sup> ; similar to autoNOE in CS-Rosetta : ARIA <sup>137</sup> , ASDP <sup>138</sup> for automated NOE assignment, NOE interpretation and structure calculation; EC-NMR <sup>139</sup> uses evolutionary couplings
NMR: PCS-Rosetta, GPS-Rosetta <sup>140,141</sup>	structure prediction using PCS and CS data	Christophe Schmitz, Kala Bharath Pilla	Thomas Huber	<a href="https://www.rosettacommons.org/demos/latest/protocol_capture/gps_rosetta_pcs_nmr_constraints/README">https://www.rosettacommons.org/demos/latest/protocol_capture/gps_rosetta_pcs_nmr_constraints/README</a> <a href="https://github.com/kalabharath/pcs_driven_iterative_resampling">https://github.com/kalabharath/pcs_driven_iterative_resampling</a>	Rosetta/demos/public/gps_rosetta_pcs_nmr_constraints <a href="https://github.com/kalabharath/pcs_driven_iterative_resampling/tree/master/sample_run">https://github.com/kalabharath/pcs_driven_iterative_resampling/tree/master/sample_run</a>	computational cost for proteins >200 residues can be substantial	for larger proteins, including membrane proteins, DINGO-PCS <sup>142</sup> is used which assembles larger super-secondary structure motifs with PCS
RosettaNMR framework <sup>143</sup>	using RDC/PRE/PCS/NOE/CS for ab initio, protein-protein docking, ligand docking, symmetric assembly	Georg Kuenze, Julia Koehler Leman	Jens Meiler, Richard Bonneau	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/RosettaNMR-with-Paramagnetic-Restraints">https://www.rosettacommons.org/docs/latest/application_documentation/RosettaNMR-with-Paramagnetic-Restraints</a>	Rosetta/demos/public/rosettanmr_w_paramagnetic_restraints Supp to <sup>143</sup>	computational cost for proteins >200 residues can be substantial; for systems with many residues, spin-labels, or different metal ions, calculation of tensor parameters can become time-consuming and slow down scoring	competitive methods review: <sup>134</sup> ; Xplor-NIH <sup>135</sup> , CYANA <sup>136</sup> , HADDOCK <sup>144</sup> for docking with paramagnetic restraints or CS,
mass-spec: HRF hydroxyl radical footprinting <sup>145,146</sup>	structure prediction with HRF data	Melanie Aprahamian	Steffen Lindert	<a href="https://www.rosettacommons.org/docs/latest/rosetta_basics/scoring/ms_expdata_score_terms">https://www.rosettacommons.org/docs/latest/rosetta_basics/scoring/ms_expdata_score_terms</a>	Supp to <sup>145</sup>		
mass-spec: PyTXMS <sup>147</sup>	modeling structures and complexes from MS data	Hamed Khakzad	Lars Malmstroem	<a href="https://www.rosettacommons.org/docs/latest/scripting_documentation/PyRosetta/PyTXMS">https://www.rosettacommons.org/docs/latest/scripting_documentation/PyRosetta/PyTXMS</a>	<a href="https://zenodo.org/record/1438111#.XlQUoRNKhBw">https://zenodo.org/record/1438111#.XlQUoRNKhBw</a>		no known competitors combine three different MS acquisition data to predict PPI; for analyzing MS/MS samples: StavroX <sup>148</sup> and Mass Spec Studio <sup>149</sup>
<b>DNA and RNA</b>							
RNA applications			Rhiju Das	<a href="https://www.rosettacommons.org/docs/latest/application_documentation/ma/ma-applications">https://www.rosettacommons.org/docs/latest/application_documentation/ma/ma-applications</a>

## Summary of additional protocols

### Predicting protein structures

#### fragment picker

Since optimizing the fragments for structure prediction can improve model quality, the original fragment picker application was re-implemented as an object-oriented framework that is vastly more flexible and allows incorporation of various types of restraints from secondary structure prediction or experimental data, for instance from NMR chemical shifts<sup>1</sup>.

### Small molecule ligand docking

#### RosettaLigand

Recent improvements to the algorithm rely on a low-resolution sampling step via the *TransformMover*, which combines translational and rotational perturbations in a single step, and using scoring grids for energy evaluation<sup>30</sup>. Further, the algorithm allows backbone flexibility, mimicking the induced fit hypothesis<sup>31</sup>. On a benchmark of 43 complexes, this new algorithm demonstrated an enhanced docking success by 10-15% with an effective 30-fold speedup over the original RosettaLigand performance, enabling virtual high-throughput screening (vHTS) of medium-sized ligand libraries in the order of low hundreds of thousands of ligands.

#### DARC

Alternatively, these pockets can also be used for Rosetta's *Docking Approach using Ray Casting* (DARC<sup>43</sup>) method. DARC uses ray-casting to rapidly position a ligand in the protein surface pocket<sup>43</sup>; by iterating over many candidates, DARC provides a means for very rapid virtual screening. DARC has also been adapted for GPUs<sup>44</sup>, and the newer implementation<sup>45</sup> includes features that provide improved performance in virtual screening benchmarks.

### Protein design

#### LooDo

Multifunctional proteins such as biosensors, bioswitches and tunable affinity clamps can be designed via loop-directed domain insertion (LooDo). LooDo allows inserting a domain into another by two flanking linker regions<sup>90</sup>, which are sampled *via* fragment insertion to determine relative positioning of the domains. This is followed by generalized kinematic loop closure<sup>18</sup> (GenKIC, see below) and enzyme design to optimize the interface.

#### curved beta-sheet design

*De novo* protein design is somewhat easier for structures consisting of highly regular helices and sheets as their design principles are better understood. In contrast, designing curved and twisted  $\beta$ -sheets requires a deeper understanding of the structural irregularities that enable them. These principles were implemented in the curved  $\beta$ -sheet design method to design a variety of protein folds with curved sheets (Figure 3A), creating pockets suitable for tailoring ligand-binding and enzymatic active sites<sup>12</sup>.

#### fold\_from\_loops

This approach has been used for antibodies and for vaccine design<sup>96</sup> using the *fold\_from\_loops* application, where the functional motif is used as a starting point of an extended structure that is folded following the constraints of a target topology. Iterative refinement is carried out via sequence design and structural relaxation before filtering and human-guided optimization.

### Protein interface design

#### CoupledMoves

Designing ligand-binding interfaces in proteins is challenging due to inaccuracies in the energy function (and implicit solvation), the flexibility of ligands, and the sensitivity of protein-ligand interactions to even subtle conformational changes<sup>209</sup>. Flexible backbone design methods that use pre-generated ensembles as a starting point for design<sup>92,115</sup> perform poorly in benchmarks, likely because the ensemble does not accurately describe the unbound-to-bound conformational changes. The *CoupledMoves* protocol couples backbone flexibility with changes in sidechain rotamers or ligand orientation or conformers, and leads to substantial improvements in various benchmarks<sup>210</sup>.

### Modeling peptides and peptidomimetics

#### FlexPepDock

FlexPepDock addresses this problem by allowing targeted sampling of the peptide flexibility during its docking into a given binding site, either by refining an approximate peptide conformation (FlexPepDock refinement<sup>102</sup>), or by full *ab initio* sampling of the peptide conformation (FlexPepDock *ab initio*<sup>103</sup>). Peptide docking is especially challenging when the binding site on the receptor is unknown. However, it can be simplified based on the observation that (for peptides built from canonical amino acids) the bound peptide conformation is often included in the fragments generated by the *FragmentPicker*.

## PeptiDerive

Many protein-protein interactions (PPI) are mediated by often disordered peptide segments that are responsible for most of the binding energy<sup>112,211–213</sup>. PeptiDerive<sup>111</sup> detects such segments in a PPI complex through a sliding window approach. PeptiDerive was extended to cyclized peptides and is available on the ROSIE<sup>205</sup> server.

## MFPred

Multi-specificity is common at protein-peptide interfaces, meaning that the protein can interact with multiple substrates at the same interaction site. This can be exploited for identifying and designing novel substrates. Multi-specificity can be modeled with MFPred<sup>114</sup>, which is a rapid, flexible-backbone self-consistent mean field theory-based technique. MFPred can predict experimentally determined peptide specificity profiles for a range of receptors, at equivalent or better prediction accuracy and a 10- to 1000-fold lower computational cost when compared to other methods.

## Loop modeling for structure prediction and design

### LoopHashKIC + ConsensusLoopDesign

Most Rosetta loop modeling algorithms were primarily developed for structure prediction. However, design constitutes the opposite problem, finding low-energy sequence–structure combinations that satisfy certain design goals. LoopHashKIC<sup>214</sup> addresses this problem and uses the Rosetta LoopHash algorithm<sup>215</sup> to efficiently query a database of loop conformations based on rigid-body transforms between the first and last loop residues. LoopHashKIC uses LoopHash to identify a suitable peptide fragment, and then uses KIC to find an exact solution to close the backbone. To improve the local sequence-structure compatibility in *de novo* designed loops, the *ConsensusLoopDesign* task operation accessed through Rosetta Scripts allows a user to restrict the amino acid identities of loops based on sequence profiles of naturally occurring loops with the same region of backbone dihedral angle space (Ramachandran bins)<sup>12,13</sup>.

## Modeling antibodies and other proteins in the immune system

### RosettaMHC

RosettaMHC<sup>216</sup> utilizes homology modeling and energy minimization to predict structural complexes of antigen/MHC-I/(chaperone or TCR) molecules. It is able to predict peptide antigens that bind to all known MHC-I<sup>58</sup> alleles and models peptide/MHC-I structures<sup>58</sup>. RosettaMHC is implemented in PyRosetta.

### RosettaTCR

RosettaTCR<sup>65</sup> generates models of TCRs from sequence, via template identification, grafting of loop templates onto framework regions, and minimization and loop refinement. RosettaTCR permits structural insights into TCRs, for example those targeting cancer neoepitopes<sup>217</sup>, or to identify feature sets of TCRs from high throughput sequencing. RosettaTCR can be combined with docking to generate models of TCR-peptide-MHC complexes<sup>218</sup> or TCRs in complex with non-peptide antigens bound to MHC-like proteins<sup>219</sup>.

## Using experimental data to direct modeling

### cryoEM *de novo*

A *de novo* method described by Wang et al. applies a model building approach<sup>125</sup> for density maps between 3–5Å that fits fragments into densities and scores their match based on secondary structure, fit with density, loop closure, clashes and consistency between overlapping fragments to assign sequence into densities. While this method requires >70% of the map to be assigned initially, an updated version of this method, the RosettaES<sup>128</sup> enumerative sampling approach, forgoes this requirement.

### cryoEM iterative refinement

One method<sup>129</sup> iterates between refinement with Phenix in reciprocal space to physically plausible conformations, and Rosetta in real space, because Rosetta's all-atom scoring function compensates for the lack of high-resolution data, while the density map restrains backbone and side-chain sampling in real space. Refinement can also be seeded from homology models, followed by density-guided rebuilding and refinement of coordinates and B-factors<sup>220</sup>.

## Limitations of Rosetta protocols that include experimental data into modeling

Overall limitations of incorporating experimental data into Rosetta are somewhat historical as no single framework combines the use of all types of experimental data; the restraint framework is the common denominator for some data types. Utilization of experimental data has been approached by various labs (typically with experimental expertise in these domains) over many years, with developers having different skill levels in software engineering and preference of user interface, so unfortunately no single ideal solution exists. For example, cryoEM is implemented into the C++ restraint framework, which also holds distance restraints, for instance from NMR or EPR. Other types of NMR data were implemented via the CS-Rosetta framework (typically run through a Python interface), except paramagnetic data, which had a separate C++ implementation. The same is true for mass-spec data, one implementation exists in C++, the other as a Python interface

outside of Rosetta. Further limitations are that experimental data is often implemented as separate score terms, slowing down sampling and scoring, and most methods are limited by the size of the biomolecule. However, one of our software's advantages is that its fragment assembly approach is capable to handle sparse data.

## Modeling nucleic acids and their interactions with proteins

### FARFAR

The *Fragment Assembly of RNA with Full-Atom Refinement* (FARFAR) structure prediction protocol<sup>159,160</sup> also permits working with chemically modified nucleotides, picking fragments for the most chemically similar base available<sup>152</sup>. Homologous fragments can automatically be eliminated from fragment sets to give pseudo-blind prediction results<sup>152</sup>. As another connection of Rosetta's RNA tools to experimental structural biology, <sup>1</sup>H NMR data can be used for RNA modeling via the CS-Rosetta-RNA protocol<sup>164</sup>.

### Scorefunction

#### AmbRose

Further, a consensus scoring method, which utilizes the semi-orthogonal nature of the Rosetta and Amber energy functions, was developed for model ranking to identify most near-native models<sup>221</sup> from the pool of generated decoys. This approach led to the development of a Python-based tool (AMBRose) for interconversion between Rosetta and Amber models to facilitate consensus scoring.

## Additional information about user interfaces

### command line

Structure input and output was enhanced by the ability to read and write mmCIF files (via an external library) using the same mechanisms as PDB files, which permits representation of large complexes that are ill-suited for the PDB format (e.g. the ribosome). This comes with the ability to read the Protein Databank's Chemical Component Dictionary, the description of the chemical composition of residues in the officially released PDB structures. Multithreading support has been added, which required a major refactor of its core architecture for thread-safety, allowing shared-memory parallelism. Multithreading is currently available for specific protocols (*simple\_cycpep\_predict*) with planned expansion to other applications (including the *JobDistributor* jd3).

### RosettaScripts

RosettaScripts<sup>194</sup> is a popular scripting interface that uses Extensible Markup Language (XML) to build fairly complex protocols using core machinery<sup>222</sup>. Comprehensive knowledge of the codebase is unnecessary since most of the underlying modules<sup>177</sup> have been thoroughly documented – documentation is now also generated using XML schema, which validates the RosettaScripts XML files at runtime. RosettaScripts was further extended and generalized to enhance consistency: *ResidueSelectors* enable selection of residues based on specific properties such as chain, amino acid, secondary structure, index, solvent accessible surface area, and others, and can be used in conjunction with *MoveMapFactories*, which control a structure's flexibility during energy minimization. *ResidueSelectors* are also accepted by *TaskOperations* which control side-chain identity and optimization. A more general analysis tool, *SimpleMetrics*, allows custom analyses of models through RosettaScripts and writes the output into the scorefile. The *SimpleMetrics* system is more integrated and robust than previous tools, such as the *InterfaceAnalyzer* or the *FeaturesReporter*.

### PyRosetta

PyRosetta<sup>192,193</sup> is a collection of Python bindings to the source code, exposing ~7,400 classes and 88,000 functions. PyRosetta allows custom protocol development that is flexible and fast, but it requires familiarity with the underlying structure of the codebase. Not all of options available in RosettaScripts have corresponding API-level configuration, so in order to take full advantage of those protocols, PyRosetta can now configure objects using RosettaScripts XML. This brings the added advantage of harmonizing the documentation across multiple interfaces.

### InteractiveROSETTA

InteractiveROSETTA<sup>195</sup> is a graphical interface for PyRosetta that presents easy-to-use controls for several of the most widely-used protocols alongside a selection system that uses PyMOL as a visualizer. InteractiveROSETTA is capable of interacting with remote servers running a standalone Rosetta install, rendering it easy to incorporate more sophisticated protocols that are not accessible in PyRosetta and/or require significant computational resources.

### Foldit Standalone

Foldit Standalone<sup>196,198</sup> is a graphical interface based on the Foldit video game<sup>197,199</sup>. Foldit Standalone provides several interactive structure manipulations, including pulling directly on the structure, rigid body docking, and residue mutation, insertion and deletion. Users can apply hard and soft constraints that guide automated moves such as packing and minimization, and provides real-time scoring updates as the structure changes. Additional features include multiple sequence alignments for template-based modeling, along with electron density-, Ramachandran-, and contact-map

visualizations. Further, scientists and educators can now run their own custom Foldit puzzles for a group of their choosing, a new feature called “Custom Contests”<sup>223</sup>.

#### Usability and debugging

Command line executables accept a -info option, which prints relevant options for the current application in RosettaScripts, and debugging command lines is facilitated by improved error messages. Default, system-wide options (e.g. database paths) can now be specified in a *rosetta.rc* file. Lastly, code development in C++ is now easier with the help of available code templates that create much of the boilerplate code required to extend the software.
